

AstroMind Test Fixture

This document is a synthetic fixture used by the AstroMind test suite. It is not based on any external source. Each page below asserts a single fact that tests can verify by citation.

The Sun

The Sun is the star at the center of the Solar System. Its core temperature is approximately 15 million kelvin. It is classified as a G-type main-sequence star (G2V).

Jupiter

Jupiter is the largest planet in the Solar System.

Its mass is approximately 318 Earth masses.

Jupiter has at least 95 known moons, the four largest being Io, Europa, Ganymede, and Callisto.

Saturn

Saturn is the second-largest planet in the Solar System. It is best known for its prominent ring system, made mostly of water ice with traces of rocky material.

Exoplanets

An exoplanet is a planet outside our Solar System.

TRAPPIST-1e is a confirmed exoplanet in the habitable zone of TRAPPIST-1, announced in February 2017.

The most productive detection method has been transit photometry.
